John Filhmar Ola

Lead IT · Full-Stack Engineer · DevOps & Infrastructure

olajohnfilhmar@gmail.com | +63 977 735 3309 | Dasmariñas, Cavite, Philippines
Portfolio: filhmar.online | LinkedIn: linkedin.com/in/john-filhmar-ola-631a15344 | GitHub: github.com/JohnFilhmar

PROFESSIONAL SUMMARY

Lead IT at YouCode Technologies Corporation, responsible for multiple production systems end to end — architecture, full-stack development, automated testing, CI/CD, and on-premise infrastructure operations. Sole developer of a distributed real-time messaging platform spanning mobile client, backend microservices, deployment pipeline and production server management. Comfortable owning a system from first commit through to live operation, incident diagnosis and iteration. Promoted to a lead role within the first year. Fast learner across languages and stacks, with a track record of shipping systems that reach real users.

TECHNICAL SKILLS

Languages	TypeScript · JavaScript · Python · Bash · PHP · C · C++ · C# · Java
Frontend & Mobile	React · React Native (Expo) · TailwindCSS · HTML5 · CSS · Responsive UI development
Backend	NestJS · Node.js · Express · gRPC · RabbitMQ · REST APIs · WebSocket real-time services · Microservice architecture
Databases & Storage	PostgreSQL · MongoDB · MySQL · Redis · S3-compatible object storage (MinIO) · Schema design & migration
DevOps & CI/CD	Docker · Docker Compose · GitHub Actions · Self-hosted runners · Traefik · nginx · Automated build, test and deploy pipelines
Infrastructure	Linux (Ubuntu/Debian) administration · On-premise VPS & bare-metal · systemd · cron automation · WireGuard VPN · SSH hardening · Networking
Security Engineering	SAST (Semgrep, CodeQL) · SCA (Snyk, Dependabot) · DAST (OWASP ZAP) · Container scanning (Trivy) · Secret scanning (gitleaks) · Image signing (cosign) · SBOM & build provenance
Monitoring & Testing	Prometheus · Grafana · Loki · node-exporter · cAdvisor · Load testing (k6) · Performance benchmarking (fio) · Incident diagnosis
Embedded / IoT	Arduino · C/C++ · Sensor integration · GSM/SMS messaging
Practices	Full-stack ownership · Microservice design · Technical documentation · Code review · Agile delivery · Cross-team collaboration

PROFESSIONAL EXPERIENCE

YouCode Technologies Corporation

Lead IT (promoted 2026) · previously Developer | July 2025 – Present | Philippines

- **Promoted from Developer to Lead IT within the first year;** own multiple production systems end to end — architecture, full-stack development, automated testing, CI/CD, security automation, and on-premise infrastructure across the company's commercial product suite.
- **Own CI/CD across the product suite** — automated build, test, security scanning, artifact signing and deployment pipelines, including self-hosted runner infrastructure.
- **Lead on-premise infrastructure operations** : server provisioning, container orchestration, monitoring stack deployment, and production incident diagnosis; authored automated diagnostic tooling for resource saturation and service health.
- **Designed cross-product notification architecture** — all company systems dispatch push notifications through the in-house messaging platform, consolidating delivery infrastructure and reducing SMS dependency and cost.
- **Established performance and capacity baselines** through load testing and infrastructure benchmarking; produced formal technical findings and requirement specifications used in vendor and stakeholder decisions.

Ynnovision Enterprise Solutions

Frontend / Web Developer Intern (486 hours) | Feb 2025 – May 2025 | Trece Martires, Cavite

- Delivered assigned development tasks to deadline with consistent code quality; contributed improvements to system stability and usability.

PROJECTS

Usapp — usapp.ph (iOS & Android)

Sole developer & architect | YouCode Technologies Corporation

- Private, end-to-end-encrypted one-to-one messaging platform for the Philippine market — passwordless OTP sign-in, real-time delivery and read receipts, typing indicators, and push notifications; built solo across mobile client, backend, and production infrastructure.
- React Native (Expo) app over a NestJS microservice backend (API gateway, auth, messaging, notification, media, integration) communicating via gRPC and RabbitMQ, with Socket.IO real-time delivery, a PostgreSQL / MongoDB / Redis data layer, and a partner business-messaging API.

Civic Super App Platform — MyDasma · MySorsogon · MyLegazpi

White-label multi-tenant LGU platform | YouCode Technologies Corporation

- White-label, multi-tenant civic super-app that lets each local government unit run its own branded app and admin consoles from one shared platform — every per-city difference is configuration, not code; three cities live in production.
- Offline-first Expo / React Native resident app plus React admin consoles over a NestJS microservice backend: e-Gov services, 311 reporting, one-tap emergency SOS with live dispatch and command map, targeted alerts, and self-hosted maps, with strict per-tenant data isolation.

YouCode HRIS

Per-client SaaS HRIS | YouCode Technologies Corporation

- Distributable, per-client HRIS spanning the full employee lifecycle — onboarding, time & attendance, leave, payroll, performance, and compliance — with client-specific policies, branding and SSO configurable in-app without code changes.
- Next.js 15 / React 19 permission-aware frontend over NestJS microservices (identity, payroll, attendance, leave, records, compliance) communicating via gRPC and RabbitMQ, each owning its own PostgreSQL database; shipped as an isolated Docker deployment per client.

Resilient-Learn — offline-first LMS (PWA)

Learning management platform | YouCode Technologies Corporation

- Offline-first learning management system for large, distributed organisations — on-device computer-based testing, an offline course player with video, and cryptographically signed micro-credentials with public verification — built so a dropped connection never loses a learner’s work.
- Monorepo of four deployable apps (installable PWA, NestJS backend, background worker, public verifier) with encrypted on-device storage, a shared resumable drip-sync and conflict-resolution protocol, PostgreSQL, Redis job queues, and S3-compatible media storage.

YouGuard Master Bridge Server — access-control & surveillance gateway

Sole developer | YouCode Technologies Corporation

- Single self-hosted Go service bridging on-site turnstiles and face-recognition cameras to the SMIS cloud over one authenticated WebSocket — powering automated daily attendance capture and real-time security alerts, buffering durably and replaying when the cloud is unreachable.
- Hexagonal architecture with runtime-configurable protocol listeners (WebSocket / MQTT / HTTP / TCP / UDP) and per-vendor adapters, an embedded React admin console with a WebRTC video wall, PostgreSQL / MongoDB storage, and a MediaMTX media sidecar; ships as one static binary.

YouFlow — kanban.youcodetech.com

Sole developer | YouCode Technologies Corporation

- AI-integrated, self-hostable Kanban workspace for teams working alongside AI agents — architected end to end across a three-package monorepo (Express 5 API, Next.js 15 PWA, MCP server), with full CI/CD, cosign-signed images, and SOPS-encrypted secrets.
- Ships an MCP (Model Context Protocol) server that lets AI assistants drive the board as permission-scoped team members, AI-suggested story-point estimation with a supervisor confirmation gate, and automated End-of-Day reports over SMS or email.

JMS E-Talyer — jms-e-talyer.shop

Sole developer, owner and maintainer | ongoing

- Multi-branch automotive service management system with real-time monitoring and daily transaction reporting. **Live in production** on a self-provisioned rented VPS that I provision, manage and operate, with features actively being developed.
- Built and operate the complete delivery pipeline: automated testing, static analysis, dependency and container vulnerability scanning, secret scanning, and automated dependency updates — with hardened container runtime and manual-gated production deploys.

PeraPlano — personal finance & budget management application

Sole developer | in development, Android release planned

- Free-to-use budgeting application with encrypted user financial data, deriving budget movement from transaction push notifications to minimise manual entry. Supports daily, monthly and annual goals with threshold alerts.

Kalusugapp — kalusugapp.com

- Digitised health records and appointment management for rural clinics, improving record accessibility and scheduling efficiency.

Flood Notification System — IoT early-warning platform

github.com/JohnFilhmar/FloodSystem

- Sensor-based early-warning system alerting nearby residents to rising flood water through audible sirens, warning lights and automated SMS dispatch; monitors water level and rate of rise per area.
