John Filhmar Ola

Lead IT · Full-Stack Engineer · DevOps & Infrastructure

olajohnfilhmar@gmail.com | +63 977 735 3309 | Dasmariñas, Cavite, Philippines
Portfolio: filhmar.online | LinkedIn: linkedin.com/in/john-filhmar-ola-631a15344 | GitHub: github.com/JohnFilhmar

PROFESSIONAL SUMMARY

Lead IT at YouCode Technologies, responsible for multiple production systems end to end — architecture, full-stack development, automated testing, CI/CD, and on-premise infrastructure operations. Sole developer of a distributed real-time messaging platform spanning mobile client, backend microservices, deployment pipeline and production server management. Comfortable owning a system from first commit through to live operation, incident diagnosis and iteration. Promoted to a lead role within the first year. Fast learner across languages and stacks, with a track record of shipping systems that reach real users.

TECHNICAL SKILLS

Languages	TypeScript · JavaScript · Python · Bash · PHP · C · C++ · C# · Java
Frontend & Mobile	React · React Native (Expo) · TailwindCSS · HTML5 · CSS · Responsive UI development
Backend	NestJS · Node.js · Express · gRPC · RabbitMQ · REST APIs · WebSocket real-time services · Microservice architecture
Databases & Storage	PostgreSQL · MongoDB · MySQL · Redis · S3-compatible object storage (MinIO) · Schema design & migration
DevOps & CI/CD	Docker · Docker Compose · GitHub Actions · Self-hosted runners · Traefik · nginx · Automated build, test and deploy pipelines
Infrastructure	Linux (Ubuntu/Debian) administration · On-premise VPS & bare-metal · systemd · cron automation · WireGuard VPN · SSH hardening · Networking
Security Engineering	SAST (Semgrep, CodeQL) · SCA (Snyk, Dependabot) · DAST (OWASP ZAP) · Container scanning (Trivy) · Secret scanning (gitleaks) · Image signing (cosign) · SBOM & build provenance
Monitoring & Testing	Prometheus · Grafana · Loki · node-exporter · cAdvisor · Load testing (k6) · Performance benchmarking (fio) · Incident diagnosis
Embedded / IoT	Arduino · C/C++ · Sensor integration · GSM/SMS messaging
Practices	Full-stack ownership · Microservice design · Technical documentation · Code review · Agile delivery · Cross-team collaboration

PROFESSIONAL EXPERIENCE

YouCode Technologies

Lead IT (promoted 2026) · previously Developer | July 2025 – Present | Philippines

- **Sole developer of Usapp** (usapp.ph), a secure real-time messaging platform — architected and built from scratch across the mobile application, distributed backend microservices, deployment pipeline and production server management.
- **Delivered production systems now in active commercial marketing**: an LGU citizen-services application, a flexible-hierarchy HRIS serving government and private-sector clients, and a learning management system.
- **Own CI/CD across the product suite** — automated build, test, security scanning, artifact signing and deployment pipelines, including self-hosted runner infrastructure.
- **Lead on-premise infrastructure operations**: server provisioning, container orchestration, monitoring stack deployment, and production incident diagnosis; authored automated diagnostic tooling for resource saturation and service health.
- **Built hardware-to-server integration** for a campus management system, enabling automated daily attendance capture and school security monitoring from on-site devices.
- **Designed cross-product notification architecture** — all company systems dispatch push notifications through the messaging platform, consolidating delivery infrastructure, reducing SMS dependency and cost, and establishing the platform as the group's super-app foundation.

- **Established performance and capacity baselines** through load testing and infrastructure benchmarking; produced formal technical findings and requirement specifications used in vendor and stakeholder decisions.

Ynnovision Enterprise Solutions

Frontend / Web Developer Intern (486 hours) | Feb 2025 – May 2025 | Trece Martires, Cavite

- Delivered assigned development tasks to deadline with consistent code quality; contributed improvements to system stability and usability.

PROJECTS

JMS E-Talyer — jms-e-talyer.shop

Sole developer, owner and maintainer | ongoing

- Multi-branch automotive service management system with real-time monitoring and daily transaction reporting. **Live in production** on a self-provisioned rented VPS that I provision, manage and operate, with features actively being developed.
- Built and operate the complete delivery pipeline: automated testing, static analysis, dependency and container vulnerability scanning, secret scanning, and automated dependency updates — with hardened container runtime and manual-gated production deploys.

PeraPlano — personal finance & budget management application

Sole developer | in development, Android release planned

- Free-to-use budgeting application with encrypted user financial data, deriving budget movement from transaction push notifications to minimise manual entry. Supports daily, monthly and annual goals with threshold alerts.

Kalusugapp — kalusugapp.com

- Digitised health records and appointment management for rural clinics, improving record accessibility and scheduling efficiency.

Flood Notification System — IoT early-warning platform

github.com/JohnFilhmar/FloodSystem

- Sensor-based early-warning system alerting nearby residents to rising flood water through audible sirens, warning lights and automated SMS dispatch; monitors water level and rate of rise per area.
